

Risk scales, deliverable D5 and the strategy note

Closing the day by delivering, not by tidying up

Session objectives

What this lab teaches:

- **Build** the MERIDIAN group's severity and likelihood scales, described level by level in the terms of the group's business lines
- **Justify** each scale level so that a workshop participant tomorrow rates the way the scale's author does today
- **Assemble** deliverable D5, the group's initial assessment file, from everything the day has produced

- **Enrich** the strategy note with a “major risks” subsection articulated with the subsections of the previous sessions

Prerequisites

- The day's productions: the appetite from the CISO's briefing, the framing, the feared events, the baseline and the RO/TO (risk origin / target objective) pairs from the tutorial, the previous lab's data entry in CISO Assistant.
- The « Matrice 4x4 EBIOS-RM » matrix imported in the previous lab: the scales produced must match it.
- The group's strategy note, in the state session 4 left it in: four subsections, from context to state of play.

Why scales, and why now

This morning, severities were rated by expert judgment on a generic four-level scale. That was enough to learn the gesture, and it is not enough for a real group: a scale whose levels are not described in business terms produces ratings that vary with mood and person. The EBIOS RM (expression of needs and identification of security objectives, the ANSSI (the French national cybersecurity agency) method) guide provides an example scale for a fictional biotechnology company; tonight's exercise consists in doing for MERIDIAN what that model does for it: describing, level by level, what “critical” or “minor” mean WHEN ONE IS that particular group, with care to provide, freight to trace and public users to serve. It is the last piece the deliverable was missing, and it is this sequence's reason for being: session 7 will rate the entire risk register with the scales set tonight, as they are. A scale that will need touching up two sessions from now is a scale that failed tonight.

✓ Exercise 1: the group's scales (15 minutes)

Build the group's severity scale: four levels, numbered G1 to G4, aligned with the matrix imported into the tool. For each level, write a one-to-two-sentence description that answers three questions: what effect on the group's missions, what effect on people, and does the group recover, in how much time. Lean on the logic of the guide's model, which grades from consuming operating margins up to the organization's threatened survival, and translate it onto the group's realities: safety of care on the Santé side, continuity of flows on the Logistique side, compliance and trust on the Territoires and Éducation side.

Then handle likelihood, and it is subtler than it looks: the four levels V1 to V4 of the tool's matrix already carry their labels, from « Peu vraisemblable » (unlikely) to « Certain » (certain). They are not to be rewritten; write for each one an interpretation sentence specific to the group, saying on which signals one rates at that level. Without those sentences, two workshop participants will rate the same situation V2 and V3, and the matrix will settle disagreements it should have prevented.

Finish with the threshold: transfer onto the matrix grid the acceptance threshold that translates the appetite formulated this morning at the CISO's briefing. The matrix's risk levels are « Faible », « Moyen » and « Élevé » (low,

medium, high); state which of these levels the proposed appetite makes unacceptable as it stands, which is tolerable under conditions, and which is acceptable, with one sentence of justification each. The morning's vocabulary is recognizable: this is where the appetite stops being a speech and becomes a line on a grid.

Exercise 2: assembling deliverable D5 (15 minutes)

D5 is the group's initial assessment file: the documentary proof that Workshops 1 and 2 were conducted with method. It is made of four sections, and all of its content already exists in the day's productions; the exercise is a demanding assembly, not new writing.

D5 section	Content	Where it comes from
1. Study framing	Objective, scope, participants and roles, person responsible for accepting the residuals, cycles, justified severity and likelihood scales	Tutorial exercise 1, tonight's lab exercise 1
2. Security baseline	Applicable frameworks, state of application, justified deviations carried over from the audit, decision on how to proceed	Tutorial exercise 3, session 4 audit
3. Risk origins	The retained and prioritized RO/TO pairs, each motivated, the list of secondary pairs under watch	Tutorial exercise 4, previous lab's data entry
4. Feared events	The feared events rated in severity, backed by the mapping's business assets	Tutorial exercise 2, session 2 assets

Assemble the document, one to two pages excluding tables, and check it against its acceptance criteria before submitting it: those criteria are what will be applied, not the impression of completeness.

The acceptance criteria for D5:

- the file's business assets and supporting assets are IDENTICAL to those of the session 2 mapping, reused, neither recreated nor renamed;
- each risk origin / target objective pair is motivated in one sentence;
- the scales are reusable as they are in session 7: levels described in the group's terms, acceptance threshold set, no rework to be expected.

✓ Strategy note (15 minutes)

Last quarter of an hour, the module's ritual: the group's strategy note gains its fifth subsection, "major risks". Half a page at most, and management-level content, not technician-level: the three retained risk origin / target objective pairs, phrased in one line each in language a board member understands; the most serious feared event in the file and what makes it credible; and the acceptance threshold Executive Management is asked to confirm, inherited from the morning's appetite.

The articulation with the existing text is, as always, the real criterion. The "context and target governance" subsection from session 1 established who decides: the acceptance threshold proposed tonight leans on it explicitly, it is the same governance speaking. The "critical assets" subsection from session 2 established what matters: the major risks must target THOSE assets, and if one of the retained pairs threatens none of them, one of the two subsections is wrong, and it must be said which. The "state of play" subsection from session 4 established the deviations: the note can now say in one sentence what those deviations change about the risk, which is very different from repeating them. The document's constraints remain the same: three to five pages of text for the whole, tables and appendices not counted, nothing gets deleted, everything can be amended with one sentence of justification, and the note is the file's common thread, assessed with the deliverables.

And to close the session, the sentence that hands it over: the risk origin / target objective pairs and the feared events set today become the raw material of session 6, which will build the strategic then operational scenarios across the group's ecosystem, its providers and its projects; and the scales set tonight will be used, unchanged, to rate the full register in session 7.
